1.1 The Parametric Equations

The ten(10) 2D parametric curves covered in this work are:

- 1. Teardrop
- 2. Butterfly
- 3. Ellipse
- 4. Skewed-Astroid
- 5. Circle
- 6. AstEpi = Astroid + Epicycloid combination
- 7. Snailshell
- 8. SnaHyp = Snailshell + Hypotrocoid combination
- 9. Ribbon-10L
- 10. Ribbon-100l = 10 times scaleup of Ribbon-10L

The parametric equations describing each of the curves x(u), and y(u) are provided in the next table. The independent parameter u is limited to

$$u \in [0.0, 1.0]$$

The curves were selected based on their different characteristics like closed loop curves, open ended curves, symmetric or non-symmetric about the x-axis and y-axis, and having concave or convex turns. The x and y dimensions (sizes) vary among the different curves.

The main objective of the selection criteria is to ensure that the interpolation algorithm for the parametric curve succeeds and does not break in all cases.

The results for the feedrates in machining the ten(10) curves show continuity, smoothness, with no abrupt jumps as the CNC machine traverse the entire curve from the start (u = 0.0) until the end (u = 1.0).
